DETAILED ACTION

Allowable Subject Matter

Claims 1-36, 39, 40, and 45-48, 51, 53-77 are allowed.

The following is a statement of reasons for indicating the allowable subject matter: the claimed invention is directed to a display system. Claims 1, 30, 31, and 34 identify a uniquely distinct feature” wherein the displays and the beam splitter are in respective planes that are parallel to a common linear axis, wherein light output from the displays is linear polarized, wherein the light output from one of the displays that is reflected by the beam splitter has a polarization direction at 45 degrees to the linear axis and is transmitted along an optical path, whereby upon reflection by the beam splitter the polarization direction of the reflected linear polarized light relative to the polarization direction of the linear polarized prior to reflection is rotated 90 degrees about the optical path”. Claim 59 identifies a uniquely distinct feature “wherein the displays and the beam splitter are in respective planes that are parallel to a common linear axis, wherein the light incident on the beam splitter from the two displays has circular polarization in the same sense, whereby upon reflection by the beam splitter the polarization sense of the reflected circular polarized light is reversed relative to the polarization sense of the circular polarized light-prior to reflection”. Claim 64 identifies a uniquely distinct feature “wherein the light representing the respective images as it is incident on the beam splitter has circular polarization in the same sense, said combining comprising reflecting light representing one of such images, whereby such reflecting reverses the polarization”.

direction of the reflected light". Claim 70 identifies a uniquely distinct feature "wherein the displays are in respective planes that are parallel to a linear axis and forming said images is polarized light, wherein the polarized light representing respective images is circular polarized having the same sense, wherein said combining comprising reflecting into such common light path such polarized light forming said one of said images by using the beam splitter with the beam splitter in a plane that is parallel to and intersects the linear axis, whereby the polarization sense of polarization of the reflected circular polarized is reversed by reflection by the beam splitter such that the sense of the light reflected by the beam splitter is opposite the sense of polarization of the light transmitted by the beam splitter".

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Christie teaches an autostereoscopic image displays provide highly realistic three-dimensional images to one or a plurality of viewers without the need for wearable appliances. In some embodiments, the images are viewed through a beamsplitter, while in other embodiments the viewer observes the images on a display screen. A viewer-tracking system monitors the viewer's movements and directs each image of a stereopair to the proper eye of the viewer. In some embodiments, the stereoimages are kept independent and separately directed through differential polarization. In other embodiments, this is accomplished through selective intensity modulation. Ferguson teaches a passive dithering display system includes an optical display including a plurality of pixels with optical dead space between the pixels for producing an image, and a birefringent material for shifting one polarization component

Art Unit: 2674

of the image relative to a second polarization component of the image such that the shifted polarization component lies in the dead space. Thus, the system of the invention can change the location of an optical signal, and the change can be used to improve resolution of a display, to reduce fixed pattern noise of a display, to facilitate locating and hiding of circuitry, to facilitate overlapping of tiles or pixels, etc. The closest arts, Christie and Fergason as discussed above, either singularly or in combination, fails to anticipate or render the above underlined limitations obvious.
